I notice the nightly job keys off now.date(), which could misbehave if a catch-up run happens after midnight and shifts the date forward—worth flagging but I'll hold off for now. Next I want to read through main.py, web.py, the logs template, and the LLM test file before starting implementation.

>_ Read lines 1–86 of main.py and 2 other actions

>_ Read lines 160–215 of tests/test_core.py and 1 other action

I'm designing the new llm.py module to handle calls to any OpenAI-compatible API endpoint, with automatic retry logic for timeouts and server errors, plus handling for 400 errors caused by unsupported parameters.

>_ Searched replenish/data_sources.py and 4 other files for "^def \|^class \|^ def " and 2 other actions

I'm examining the first flagged issue: an urgent CROI stockout order placed right before the nightly run could create a double order, since the nightly process only accounts for approved POs and would miss the still-pending urgent approval, leading it to suggest ordering CROI again

>_ Read /tmp/review/repro/check_bugs.py and 1 other action

The repro confirms the issue. Now I'll look at purchase_order.build_purchase_orders and decide() to address fix #4, then check planner.plan_purchases for #5.

>_ Searched replenish/purchase_order.py for "def build_purchase_orders" and 1 other action

For fix #4, I'm adjusting build_purchase_orders to accept an optional order_date parameter so delivery dates are computed from that date plus lead time instead of always using today. In decide, I'm fetching the run's business_date to use as the order_date basis, falling back to today if

>_ Read replenish/scheduler.py and 1 other action

I'm checking the catch-up logic: the misfire grace time is set to 1 hour, and since catch_up() compares against today's scheduled time, it only triggers for runs missed shortly after midnight if the nightly time is late enough, like 23:30, to fall within that grace window.

Reviewer found five real issues; I'll fix four (one is a documented design trade-off) alongside the AI work. Writing the new LLM client first.

Ran 9 commands and created 2 files +304

You've used all your credits. Add credits in Billing to continue.

The user wants me to continue optimizing their Cafe AI Replenishment model, debug it,

我先读一下你新传的 v3 文件，再对照现在的代码继续优化和调试。

Ran 26 commands, read 8 files, searched 57 websites, read 9 web pages, and used 5 tools

>_ Listed attached_assets/ and 3 other actions

This v3 upload is also 0 bytes, the third empty file in a row. The naming pattern suggests the user may have renamed my v2.1 version into a v3, or they're pulling it from another tool/canvas that isn't preserving the actual content on export.

>_ Read .local/skills/external-apis/SKILL.md and 1 other action

>_ Counted lines in main.py and 3 other files and 1 other action

I notice the listed external APIs don't include an LLM provider directly, but Replit Projects offer AI integrations (OpenAI, Anthropic, Gemini) through Replit-managed keys billed to credits, configured via environment variables the agent sets up.

Opened llm.py

Opened forecast.py

Opened main.py

I'm going to look at config.py and demo.py, plus the forecast/LLM-related parts of workflow.py and the LLM client test, so I can plan what improvements to make.

Opened config.py

Opened demo.py

Since the v3 file is empty, I should work from the original requirements, with the main focus being how to use the AI model. I'm thinking through improvement priorities, starting with making AI model setup easier by presetting domestic model providers so configuration is simpler.
